

# Molecular Orbitals in Inorganic Chemistry

Prof. P. Hunt  
[p.hunt@imperial.ac.uk](mailto:p.hunt@imperial.ac.uk)  
Rm 110F (MSRH)

# Outline

- octahedral complexes
- forming the MO diagram for  $O_h$
- colour, selection rules
- $\Delta_{oct}$ , spectrochemical series
- forming the MO diagram for  $C_{4v}$

# Octahedral Complexes

- **very large and important class of transition metal complexes**
- **TM complexes act as catalysts**
  - ✦ to control and improve catalysts we need to understand the underlying electronic structure
- **magnetic properties, colour!**

**Removed due  
to copyright**

# MO checklist

## Steps to construct a MO diagram

- ✦ determine the molecular shape and identify the point group of the molecule
- ✦ define the axial system and find all of the symmetry operations on the molecule
- ✦ identify the chemical fragments, and put them along the bottom of the diagram
- ✦ determine the energy levels and symmetry labels of the fragment orbitals (use H1s as a reference)
- ✦ combine fragment orbitals of the same symmetry, estimate the splitting energy and draw in the MO energy levels and MOs (in pencil!)
- ✦ determine the number of electrons in each fragment and hence the central MO region, add them to the diagram
- ✦ identify if any MO mixing occurs, determine the mixed orbitals and redraw the MO diagram with shifted energy levels and the mixed MOs
- ✦ annotate your diagram
- ✦ use the MO diagram to understand the structure, bonding and chemistry of the molecule

work through for  
an octahedral  
molecule

# Steps 1-2: Point Group

● determine molecular shape: octahedral

● determine the point group of the molecule

✦ find  $O_h$  in your character tables

● define the axial system

● find all of the symmetry operations

| $O_h$    | E | $8C_3$ | $6C_2$ | $6C_4$ | $3C_2$ | i  | $6S_4$ | $8S_6$ | $3\sigma_h$ | $6\sigma_d$ |                           |
|----------|---|--------|--------|--------|--------|----|--------|--------|-------------|-------------|---------------------------|
| $A_{1g}$ | 1 | 1      | 1      | 1      | 1      | 1  | 1      | 1      | 1           | 1           | $(x^2+y^2+z^2)$           |
| $A_{2g}$ | 1 | 1      | -1     | -1     | 1      | 1  | -1     | 1      | 1           | -1          | $(2z^2-x^2-y^2, x^2-y^2)$ |
| $E_g$    | 2 | -1     | 0      | 0      | 2      | 2  | 0      | -1     | 2           | 0           |                           |
| $T_{1g}$ | 3 | 0      | -1     | 1      | -1     | 3  | 1      | 0      | -1          | -1          |                           |
| $T_{2g}$ | 3 | 0      | 1      | -1     | -1     | 3  | -1     | 0      | -1          | 1           | $(xy, xz, yz)$            |
| $A_{1u}$ | 1 | 1      | 1      | 1      | 1      | -1 | -1     | -1     | -1          | -1          |                           |
| $A_{2u}$ | 1 | 1      | -1     | -1     | 1      | -1 | 1      | -1     | -1          | 1           |                           |
| $E_u$    | 2 | -1     | 0      | 0      | 2      | -2 | 0      | 1      | -2          | 0           |                           |
| $T_{1u}$ | 3 | 0      | -1     | 1      | -1     | -3 | -1     | 0      | 1           | 1           | $(T_x, T_y, T_z)$         |
| $T_{2u}$ | 3 | 0      | 1      | -1     | -1     | -3 | 1      | 0      | 1           | -1          |                           |

Fig. 2

# Steps 3-4: Fragment Orbitals

## determine the fragments

♦ central metal and the symmetry adapted fragment orbitals for  $L_6$

Fig. 3

## determine the energy levels and symmetry labels of the fragments

♦ covered last lecture => tricks to help remember

Fig.4

Fig.5

ligands

# Set up MO Diagram

🌐 draw the fragments and  
chemical structure

✦ use place holders!

Fig 7 Page 3  
colour the  
place holders  
in on your  
notes!

Fig.6

# Set up MO Diagram

## add the fragment orbitals

- ♦ metal is electropositive dAOs are higher in energy
- ♦ ligand orbitals are bonding FOs lie deeper in energy

**Important!**

4p  $t_{1u}$

4s  $a_{1g}$

3d  $e_g t_{2g}$

$e_g$   
 $t_{1u}$   
 $a_{1g}$

Fig.6

# Energy Diagram

- combine orbitals of the same symmetry
- estimate the extent of energy splitting
  - ♦  $a_{1g}$  are s- $\sigma$  => strong splitting energy
  - ♦  $a_{1g}$  are far apart in energy => reduces splitting

# Energy Diagram

combine orbitals of the same symmetry

estimate the extent of energy splitting

♦  $a_{1g}$  are s- $\sigma$  => strong splitting energy

♦  $a_{1g}$  are far apart in energy => reduces splitting

size matters!

antibonding  
=> large M

bonding  
=> large L

4p  $t_{1u}$   $\equiv \equiv \equiv$

4s  $a_{1g}$   $\text{---}$

3d  $e_g$   $t_{2g}$   $\equiv \equiv \equiv$

$e_g$   
 $t_{1u}$   
 $a_{1g}$

Fig.6

# Combine Orbitals

## estimate the extent of energy splitting

- ♦  $t_{1u}$  interaction is p- $\sigma \Rightarrow$  medium
- ♦  $t_{1u}$  energy difference is very large  $\Rightarrow$  decreases splitting

size matters!

Fig.7

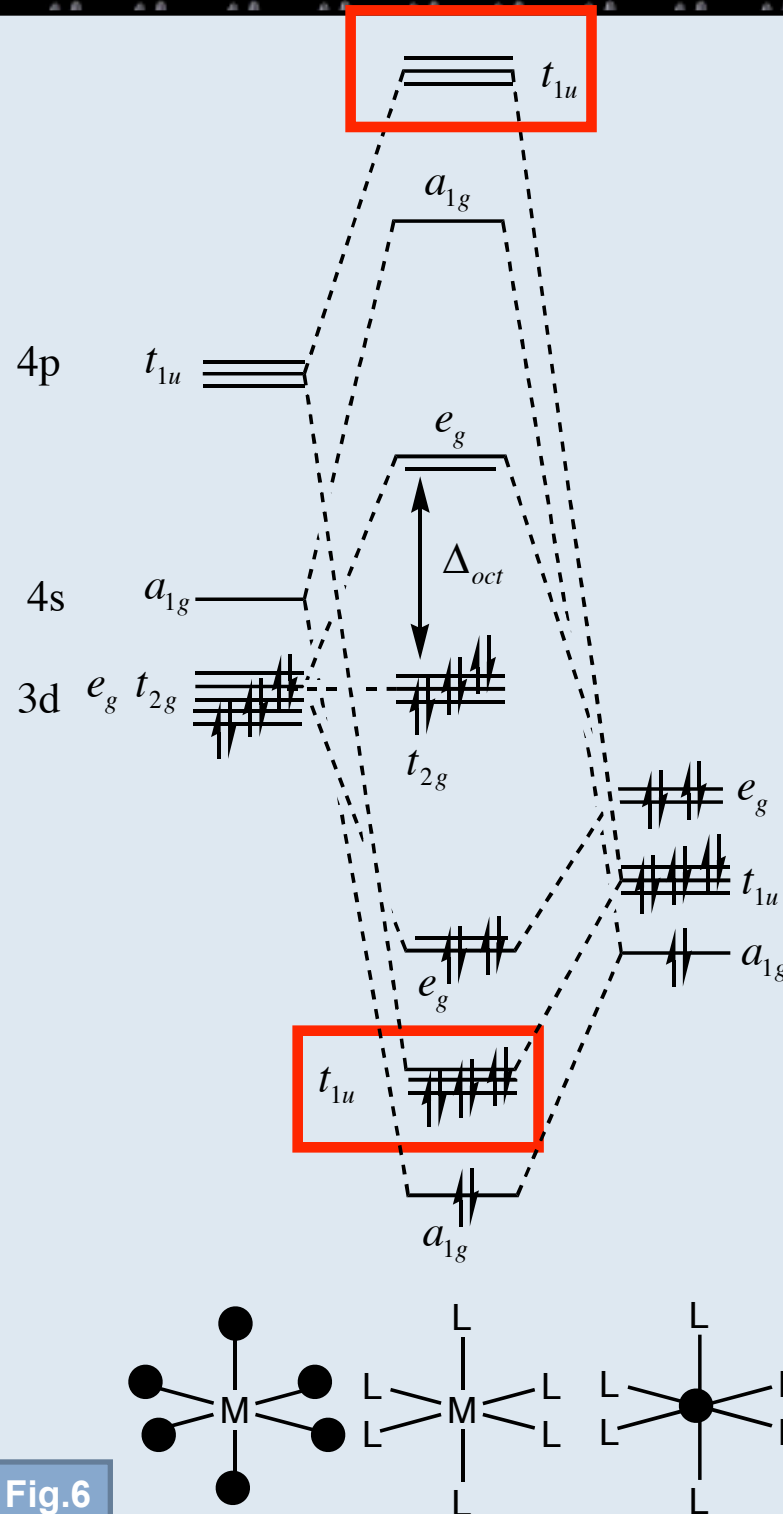

Fig.6

# Combine Orbitals

## estimate the extent of energy splitting

- ✦  $e_g$  interaction is d- $\sigma \Rightarrow$  small
- ✦  $e_g$  close in energy  $\Rightarrow$  increases splitting

Fig.7

Fig.6

# Combine Orbitals

## estimate the extent of energy splitting

- metal  $t_{2g}$  remain non-bonding as there are no ligand orbitals of this symmetry

Fig.6

# Steps: 6-8

## electronic configuration

- ♦ six 2e donor ligands = 12e
- ♦ number d electrons depends on the metal and oxidation state
- ♦ I've used six here

## determine if there is mixing

- ♦ no mixing occurs

## use MO diagram checklist!

## Energy Diagram

Fig.6

The full MO diagram!

Fig.8

# Step 9: Analysis

three lowest energy sets of orbitals are ligand based

Fig.8

for example the  $e_g$  MOs

**Important!**

Ligand  
based MOs

Fig.8

# Step 9: Analysis

- three lowest energy sets of orbitals are ligand based
- higher energy MOs are metal based

Fig.8

for example the  $e_g$  MOs

**Important!**

Fig.8

**Note!**

-  **keep all the lines for the dAOs!**

## Important!

# $\Delta_{\text{oct}}$ parameter

•  $\Delta_{\text{oct}}$  energy span of the dAO dominated MOs

•  $\sigma$ -ligands

♦  $t_{2g}$  is non-bonding

♦  $e_g$  is antibonding!

•  $\Delta_{\text{oct}}$  depends on strength of interaction:

- ♦  $\Delta\epsilon$  energy between M and L FOs
- ♦  $S_{ij}$  strength/density of overlap of FOs
- ♦  $H_{ij}$  which is hard to estimate!
- ♦ total charge on complex
- ♦ oxidation state of the M (charge on M)

Fig.8

# $\Delta_{\text{oct}}$ parameter

higher in energy the ligand FOs the better the interaction

=> larger interaction  
=> higher  $e_g$  orbital  
=> a larger  $\Delta_{\text{oct}}$

Important!

# Colour and d-d Transitions

## colour

- ✦ molecule absorbs light
- ✦ electron is excited
- ✦ d-d transition right wavelength for colour
- ✦  $[\text{Ti}(\text{OH}_2)_6]^{3+}$  absorbs in yellow/green and appears red/violet

reminder

Fig.13

Coordination Chemistry

# Colour and d-d Transitions

## Selection Rules

- ♦ d-d transitions are forbidden
- ♦ Laporte selection rule : only  $\pm 1$  for angular quantum number
- ♦ s  $\rightarrow$  p or p  $\rightarrow$  d NOT d  $\rightarrow$  d
- ♦ another form rule : must have a change of parity
- ♦ u  $\rightarrow$  g or g  $\rightarrow$  u NOT g  $\rightarrow$  g (d  $\rightarrow$  d transition involves  $t_{2g} \rightarrow e_g$ )
- ♦ spin selection rule : cannot change spin state

reminder

## d $\rightarrow$ d transitions

- ♦ rule is broken!
- ♦ weak transitions due to vibronic coupling
- ♦ vibrations and electronic structure couple
- ♦ low intensity
- ♦ broad due to vibrations (move energy levels slightly)

# Other Factors

## not only the ligands effect the size of $\Delta_{\text{oct}}$

- ✦ overall charge on the the complex
- ✦ oxidation state metal
- ✦ charge on the metal / ligands
- ✦ density of overlapping orbitals
- ✦ radius of metal (row)
- ✦ steric congestion ligands

## high charge on M

- ✦ draws ligands in
- ✦ increases overlap
- ✦ increases interaction
- ✦ increases  $\Delta_{\text{oct}}$

## large ligand

- ✦ cannot approach metal
- ✦ poor overlap
- ✦ reduced interaction
- ✦ decreases  $\Delta_{\text{oct}}$

reminder

Fig.14

# Reduce the Symmetry

- replace 1 ligand with a different  $\sigma$ -ligand
- loss of symmetry  $O_h \rightarrow C_{4v}$

## process simple:

- ♦ MOs remain the same
- ♦ just need to work out reduced symmetry labels!
- ♦ watch for degeneracy breaking

# In-Class Activity

- determine new symmetry labels for metal AOs
- determine the new symmetry labels for the ligand FOs

**VERY Important!**

use short-cuts and your character table for  $C_{4v}$

Fig.19

degenerate levels remain degenerate, I've split them for ease of interpretation

Fig.20

# In-Class Activity

 now combine the TM dAOs and the ligand FO to form the energy level diagram for a  $C_{4v}$  TM complex

Fig.18, page 10 of your notes

# In-Class Activity

now combine the TM dAOs and the ligand FO to form the energy level diagram for a  $C_{4v}$  TM complex

hint 1

add the fragment orbital energy levels

4p  $e$   $a_1$   $\equiv \equiv \equiv$

4s  $a_1$   $\text{—}$

3d  $b_1$   $a_1$   $b_2$   $e$

$b_1$   $a_1$   
 $e$   $a_1$   
 $a_1$

Fig.19

# In-Class Activity

- now combine the TM dAOs and the ligand FO to form the energy level diagram for a  $C_{4v}$  TM complex

hint 1

add the fragment orbital energy levels

hint 2

combine levels of the same symmetry

4p  $\begin{matrix} e \\ a_1 \end{matrix} \equiv \equiv \equiv$

4s  $a_1 \text{ —}$

3d  $\begin{matrix} b_1 \\ a_1 \\ b_2 \\ e \end{matrix}$

degenerate spread out to illustrate different symmetries

$\begin{matrix} b_1 & a_1 \\ e & a_1 \\ a_1 \end{matrix}$

Fig.19

# C<sub>4v</sub> Diagram

completed!

was e<sub>g</sub> now  
degeneracy is broken

Fig.19

# C<sub>4v</sub> Diagram

completed!

was  $t_{1u}$  now  
degeneracy is reduced

Fig.19

# $C_{4v}$ Diagram

completed!

Fig.19

# $C_{4v}$ TM Diagram

- primary effect of the reduction in symmetry  $\Rightarrow$  split the  $e_g$  energy levels
- ordering of  $a_1$  and  $b_1$  will depend on the ligands
- $\Delta_{\text{oct}}$  is splitting of dAO manifold (group of orbitals!)

Fig.20

# Key Points

- be able to draw energy level diagrams for octahedral TM complexes with  $L_\sigma$
- be able to draw and describe the important MOs
- be able to discuss key features of the diagrams, especially features relating to the character of the MOs
- be able to define the octahedral splitting parameter and be able to discuss key properties that impact on or effect  $\Delta_{\text{oct}}$
- be able to draw the energy diagram for a lower symmetry TM complex with  $\sigma$ -bonding ligands, including square planar

### Hunt Research Group

The Hunt Research Group is a theoretical and computational chemistry group which carries out theoretical development and computational modeling.

Our research is focused towards understanding the chemistry and physics associated with solvents and solvation, particularly as this applies to **ionic-liquids** and **deep eutectic solvents**.

We study the making and breaking of molecules. This includes **catalytic mechanisms** (for group II and frustrated Lewis acid-base pairs) and chemical **decomposition** (for green fuels, bio-fuels and ionic-liquids).

Overarching all of these areas is a specialisation in **hydrogen-bonding**, acid-base interactions and an expertise in the **MO theory** of bonding. We have developed the Effective MO Method for interrogating the electronic structure of liquids and study **charge partitioning** and interactions within molecules.

### July 2019

**Molecular orbital of the month** This is a MO from  $\text{SnOTf}_4$ . OTf is a triflate anion  $[\text{SO}_3\text{CF}_3]^-$  which coordinates to the central tin (Sn) metal through oxygen atoms.  $\text{SnOTf}_4$  is a novel catalyst for activating methane and thus producing useful molecules like methanol. Using methane from biomass or natural gas sources as a feedstock to build more complex molecules is a promising area. We also have the advantage of replacing transition metals with less expensive and more abundant main group metals. This new catalyst is unusual in that the ligand has a larger effect on reactivity than the central metal.
